Short Running Title: MRI in diagnosis of Schwannoma of the sciatic nerve

Guarantor of Submission: The corresponding author is the guarantor of submission
TITLE: Retroperitoneal schwannoma of the sciatic nerve: Case report and diagnostic review

ABSTRACT

Introduction
Schwannomas are usually benign tumors arising from Schwann cells of peripheral nerve sheaths. They are rarely located in the retroperitoneum and usually incidentally diagnosed. Sciatic nerve involvement is unusual.

Case Report
We report a case of schwannoma of the right sciatic nerve in a 39-year-old woman with an incidental diagnosis. Magnetic resonance imaging (MRI) showed a 4.5 cm sciatic nerve dependent lesion located in the right pelvic region. Surgical complete resection of the lesion was performed. Final histopathological exam revealed the tumor to be a schwannoma.

Conclusion
Schwannoma of the sciatic nerve can cause a pain in the lower limb similar to chronic sciatica. MRI is helpful in the differential diagnosis. Histopathological exam gives definitive diagnosis.

Keywords: Schwannoma, sciatic nerve, MRI
TITLE: Retroperitoneal schwannoma of the sciatic nerve: Case report and diagnostic review

INTRODUCTION
Schwannomas are rare tumors arising from Schwann cells of peripheral nerve sheaths. They are usually slow-growing benign tumors and rarely undergo malignant transformation. They occur most often in head, neck, posterior mediastinum and limbs. Retroperitoneal schwannomas account for about 2% of all retroperitoneal tumors [1, 2]. An accurate diagnosis at presentation is important to exclude a malignant retroperitoneal tumor.

CASE REPORT
We present the case of a 39-year-old woman with a past medical history of chronic sciatica associated to a herniated. A right pelvic mass of 4.5 cm was incidentally diagnosed by ultrasound examination during a gynecological check. Computed tomography (CT) of the pelvis reported the presence of a 4.5 cm nodular lesion, located deep in the right pelvic region (Figure 1). Magnetic resonance imaging (MRI) showed a dependent right sciatic nerve lesion (Figure 2). The lesion contacted with the anterior surface of the sacrum and medially displaced the right hypogastric artery (Figure 3).
A laparotomy to remove the lesion was scheduled. An encapsulated whitish retroperitoneal tumor attached to right sciatic nerve and easily resectable by blunt maneuvers was identified intraoperatively (Figure 4). The gross specimen was a smooth nodular lesion of 5 x 4 cm with soft consistency. The greyish cut surface showed the presence of cystic areas. Microscopic exam revealed a well-encapsulated lesion formed by spindle cells with eosinophilic cytoplasm and elongated nuclei without cytologic atypia or pleomorphism arranged in interlacing fascicles (Figure 5 and 6). Immunohistochemical staining showed diffuse positivity of tumor cells for S-100 protein, but was negative for smooth muscle actin (SMA).
The patient had pain on the inside of the right foot during the immediate postoperative period. A demyelinating sensory neuropathy of the right posterior tibial nerve was diagnosed by electroneurogram.
DISCUSSION

Most retroperitoneal schwannomas are benign, and usually occur in patients between 20 and 50 years [3]. Some studies have reported a higher incidence in women [4, 5]. Sciatic nerve involvement is rare.

Pelvic schwannomas are usually diagnosed incidentally, as solitary lesions, although some patients report abdominal pain or chronic sciatica. In case of chronic sciatica with no signs of radicular compression at MRI, the sciatic nerve must be radiologically examined all along its course [6]. Preoperative imaging tests are useful in determining the size, location and relationship of the lesion with neighboring tissues. CT usually reveals a well-circumscribed lesion, with round or oval slight enhancement. Schwannomas are seen as isointense lesions on T1-weighted MRI and hyperintense on T2-weighted MRI. However, many schwannomas may show mix intensity on both T1- and T2-weighted images if they are associated with cystic degeneration, necrosis and (or) haemorrhage within the tumor [7]. Neurofibromas should be considered in the differential diagnosis. An eccentric association with the nerve is suggestive of a schwannoma.

The definitive diagnosis of schwannoma is based on histopathologic and immunohistochemical findings [8]. Histologically, they are characterized by alternating areas of high and low cellularity, termed Antoni A and B regions. Mitotic figures are rarely observed. Large tumors often show cystic degeneration. Immunohistochemistry is positive for S-100, neuron specific enolasa and vimentin, but negative for SMA. Schwannomas are easily distinguished from leiomyomas or malignant peripheral nerve sheath tumors (NPNSTs). Tumor cells in leiomyomas are negative for S-100, but positive for SMA. NPNSTs have poorly differentiated cells with marked nuclear atypia and frequent mitoses.

Surgical treatment represents the only option in symptomatic patients. Management of tumor involves surgical removal by refusing fascicular groups without penetrating them and preserving the continuity of the nerve [9]. Despite the complex location of most of the retroperitoneal tumors, the laparoscopic approach is increasingly used in the management of benign pelvic schwannomas [10]. Schwannomas have a good prognosis and low incidence of recurrence if the removal has been completed.
CONCLUSION

Schwannomas of the sciatic nerve can cause pain in the lower limb similar to chronic sciatica. Although these tumors don’t have specific imaging characteristics, radiologic examinations are helpful for achieving a diagnosis. Definitive diagnosis is possible only by histopathologic evaluation after surgical resection of the tumor.

CONFLICT OF INTEREST

Authors report no conflict of interest.

AUTHOR’S CONTRIBUTIONS

A.B., M.G., A.A.,
Studied and participated on patient’s surgical treatment.

A.I.
Studied on patients’ radiological diagnosis

J.M
Prepared the pathological specimen and studied on pathological diagnosis.

All authors contributed to conception, design and acquisition of data presented in this paper.

A.B. and M.G
Participated in the final approval of the version to be published
